Digital Rim Lock

Zone digital mechanism door locks are robustly constructed and, if installed and maintained correctly, will give years of satisfactory service. The locks are relatively simple to install on most types of doors, and combination codes can be easily changed. The deadlocking latch provides additional security but the major security benefit on these type of keyless locks is that they eliminate the problems of lack of key control usually experienced on conventional locks. Note, these type of locks are not suitable for uPVC doors.

General Specification

Over 8000 different code combinations
 Auto deadlocking
 Independently performance tested
 Suitable for either left or right hand doors
 Key override version is handed – see handing guide
 Code can be easily changed in minutes
 All same size lock bodies so can be inter-changed
 Satin chrome or polished brass finishes available
 60mm backset standard. 70mm and 40mm available by special order
